

ABSTRACT OF THE DISCLOSURE

A knee joint prosthesis system adapted to replace the articulating knee portion of a femur and a tibia. The prosthesis includes a first femoral component having a first overall anterior to posterior dimension and a first overall medial to lateral dimension. The prosthesis further includes a second femoral component having a second overall anterior to posterior dimension that is substantially the same as said first overall anterior to posterior dimension and a second overall medial to lateral dimension that is different than said first overall medial to lateral dimension.
